

What is claimed is:

1. A hair styling iron comprising:

(A) a first lever including a grip portion, a plate portion equipped with an electric heater, and a fulcrum portion, and

(B) a second lever including another grip portion opposed to said grip portion of said first lever, a plate portion equipped with an electric heater and opposed to said plate portion of said first lever, and a fulcrum portion pivotally supported by said fulcrum portion of said first lever.

2. The hair styling iron of claim 1 wherein a spring is interposed between said first lever and said second lever, said spring biasing said plate portions in the direction away from each other.

3. The hair styling iron of claim 1 wherein said plate portion of said first lever and/or said second lever have ridges along the perimeter thereof.

4. The hair styling iron of claim 1 wherein said plate portion of said first lever and/or said second lever have been subjected to a flocking treatment from the perimeter to the outer surface thereof.

5. The hair styling iron of claim 1 wherein each of said fulcrum portions of said first lever and said second lever are located between the respective grip and plate portions.

6. The hair styling iron of claim 5 wherein said first lever is provided in two separate parts divided by a median plane along the both sides, which then are assembled and integrally connected after pivotally sandwiching said fulcrum portion of said second lever between the bilateral halves of said fulcrum portion of said first lever.

7. The hair styling iron of claim 1 wherein a plot lamp is provided which blinks at predetermined intervals while said electric heater is energized.

8. The hair styling iron of claim 1 wherein said fulcrum portions

of said first and second levers are located at the rear end of said respective grip portions, and a finger resting portion is provided on the outer side of each of said plate portions, with an intervening space for heat insulation being positioned therebetween.

9. The hair styling iron of claim 8 wherein said finger resting portion is a board-like or bar-like element that is continuous, at the forward region thereof, to the surface of said plate portion and, at the rearward region thereof, to said grip portion.
